DOMINION JOHN

jdominion123@gmail.com | +234 814 706 8141 | linkedin.com/in/johndominion | github.com/DOMINION-JOHN1

PROFESSIONAL SUMMARY

AI Engineer with 4+ years of experience designing, building, and operating autonomous AI agents and multi-agent systems in production across edtech, legal tech, fintech, and recruiting. Skilled at identifying where agents can add value, connecting them to third-party and internal tools, and measuring outcomes to decide what stays and what gets cut. Deep hands-on experience across OpenAI, Google Gemini, and open-source LLM stacks, backed by production deployments on GCP, AWS, and Azure with PostgreSQL-backed services. Comfortable evaluating new models and tools quickly and advising non-technical stakeholders on what AI can realistically do.

CORE SKILLS

AI Agents & Orchestration: Agentic AI, Multi-Agent Systems, LangGraph, RAG, LLM Orchestration, Autonomous Workflows, Prompt Engineering

LLM Platforms: OpenAI (GPT-4), Google Gemini, Azure OpenAI, Hugging Face, Open-Source LLMs, Claude Code

Languages & Frameworks: Python (Advanced), Go, SQL, Bash, LangChain, FastAPI, Flask, GraphQL, Streamlit, TensorFlow, PyTorch, Scikit-learn, OpenCV

Data, Search & Storage: PostgreSQL, MongoDB, Redis, Pinecone, FAISS, ChromaDB, AWS S3

Cloud & MLOps: GCP, AWS, Azure, Docker, CI/CD, GitHub Actions

PROFESSIONAL EXPERIENCE

SimplifiedIQ — ML / AI Engineer

July 2025 · Full-time · Remote

- Built a multi-modal auto-grading agent that evaluates handwriting, images, audio, video, and text responses, including math and computation-heavy subjects most grading tools skip.
- Rebuilt the question-generation engine to run 5x faster at roughly 1/30th the cost per run, while improving output quality.
- Built a 12-stage asynchronous plagiarism and authorship-detection pipeline connecting SerpAPI web discovery, page scraping, Gemini embeddings, semantic similarity scoring, citation validation, and stylometric analysis.
- Built the Examurai grading platform end-to-end, including async OCR extraction, ARQ worker orchestration, webhook delivery, and Redis idempotency controls that prevent duplicate LLM calls at scale.
- Designed a personalized development-planning agent for educators using a LangGraph multi-agent workflow, delivered in partnership with the Universal Service Provision Fund (USPF).
- Separated the AI layer into its own FastAPI service and built multi-tier Redis caching with MongoDB indexing to cut external API costs across SerpAPI calls, scraping, and embeddings.

Stringify Consulting — AI Engineer

May 2025 · Contract · Remote

- Built a multi-agent career-counseling platform with stateful LangGraph workflows that runs adaptive interviews and generates personalized career pathways and development plans.
- Built a self-healing layer for structured LLM outputs that detects malformed responses and automatically reconstructs a valid format.
- Built a retrieval pipeline that validates every learning-resource link in real time before it reaches the user, eliminating hallucinated or broken recommendations.
- Set up Redis-backed session management with multi-layer auth and proxy-aware IP resolution for secure cloud deployment.

Wazobia Technologies — Senior AI Engineer

March 2026 – April 2026 · Contract · Remote

- Built a human-in-the-loop email-approval agent system in Go, connecting an AI orchestrator, email service, and approval service through a GraphQL API, with every AI-drafted email routed through mandatory review before sending.

- Enforced a two-stage execution pipeline that blocks the LLM from triggering sends directly — a core safety requirement for the client.
- Hardened database mutation paths so sensitive email operations require authenticated human-user authorization and cannot be triggered by service tokens.

Cogrea — AI Engineer
June 2025 – March 2026 · Part-time · Remote

- Built a real-time voice AI system on Google Gemini Native Audio over WebSocket, streaming 16kHz PCM audio and generating live JSON transcripts alongside AI speech responses.
- Cut conversational turn-taking latency by 400–600ms by tuning Voice Activity Detection sensitivity and silence-window calibration.
- Co-built a multi-agent career platform with LangGraph and Gemini 2.5 Flash covering skill-gap analysis and personalized learning roadmaps.
- Built unified Redis session memory so context carries over seamlessly between text and voice channels.

Theyas Inc. — AI Engineer
May 2025 – February 2026 · Contract · Remote

- Built a RAG-based legal chatbot with a dual-index Pinecone setup (sparse keyword + dense semantic) supporting keyword search, semantic retrieval, and reranking across thousands of legal documents.
- Built an OCR pipeline that extracts and translates scanned Arabic PDFs into searchable text using a vision model.
- Built an async ingestion pipeline for PDF and DOCX files that enriches each chunk with metadata to improve retrieval precision.
- Added concurrent user session memory, containerized services with Docker, and wrote onboarding documentation for the team.

Valendata AI — AI Automation Engineer
December 2025 · Contract · Remote

- Built a reusable web-scraping framework that converts successful sessions into config templates, letting future runs replay with zero LLM calls.
- Built an eBay scraping agent directly on Browser-Use's low-level APIs, avoiding nested orchestration overhead and cutting memory use.
- Built a recursive DOM parser with five levels of parent traversal, keeping product-data extraction reliable even when site layouts change.

Afren AI — AI Engineer
April 2025 – October 2026 · Contract · Remote

- Built a real-time voice-interviewing agent on Gemini Native Audio over WebSocket, with Redis session persistence and transcript recovery so interviews survive connection issues.
- Built a semantic resume-matching engine using Gemini embeddings and cosine similarity to align candidates with job requirements.
- Built a standalone microservice that reads interview transcripts from Redis and generates structured scorecards covering communication, technical depth, and role fit.
- Co-built an agentic project-scoping tool that turns a user brief into a structured PRD, then matches candidates via Pinecone Serverless with 3072-dimension Gemini embeddings at near O(1) retrieval speed.
- Built async indexing pipelines with Redis change detection that skip unchanged candidate files, significantly cutting embedding and vector-upsert costs.

Flexisaf — AI Engineer
July 2025 – September 2025 · Contract · Remote

- Improved course-generation speed with async module processing and GPU-accelerated inference inside an AI-powered LMS that generates multimedia courses using LLMs and RAG.
- Wrote parser functions that validate and auto-correct LLM outputs to keep generated course content well-structured and consistent.

Mensa Philosophical Circle — AI Engineer

February 2025 – July 2025 · Contract · Remote

- Led development of a document-intelligence platform on GPT-4 and Azure OpenAI that ingests PDFs and DOCX files and supports natural-language querying, summarization, and content generation.
- Built the RAG backend using Azure OpenAI embeddings, Azure Cognitive Search as the vector layer, and Redis for session state.

Zummit Africa — Machine Learning Engineer

August 2023 – April 2025 · Full-time · Remote

- Built a RAG-powered support chatbot that cut response time by 65% and reduced human workload by 70%.
- Built a CV-ranking and summarization tool using Gemini and cosine similarity, improving match accuracy by 40% and review speed by 80%.
- Built a visual fashion recommender (ResNeXt50 + KNN) that lifted e-commerce engagement by 20%.
- Built a RAG-powered dental-health chatbot that cut consultation overhead by 35%.
- Built a real-time weapon-detection system using YOLO and Flask for live surveillance analytics.
- Built an LSTM model for gold-price forecasting with automated GitHub Actions retraining.
- Built an AI data-analysis app with Pandas AI and OpenAI that improved reporting speed by 40%.
- Built an automated hackathon code evaluator that cut grading time by 60%.

Swarmauri — AI Developer / Developer Relations

October 2024 – November 2024 · Contract · Remote

- Built an AI content-creation pipeline for multilingual localization and interactive storytelling using OpenAI and Groq Audio.
- Built a data-visualization tool integrating Groq models with Matplotlib that cut manual effort by 60%; created courses and Jupyter notebooks for the developer community.

EDUCATION & CERTIFICATIONS

- BSc Microbiology — Kogi State University (4.24 CGPA)
- Machine Learning & MLOps Certifications — Udemy
